Farhad Fesahat

Web Developer · Financial Markets Analyst & Trader

+98 998 117 1774 | fesahat.farhadg@gmail.com | Mashhad, Iran

Profile

I build websites end to end: from a single landing page to a complete React and Node.js application, and everything in between — including custom WordPress. Whatever a client asks for, I carry through to delivery. Alongside this I have been active in financial markets since 2018: analysis, trading and managing portfolios. Both tracks make me comfortable with data and risk, and I take technical decisions with the financial outcome in mind.

Experience

Web Developer & Designer

2024 — present

Custom, client-driven projects

- Building sites from scratch — UI through to server
- React front-end, Node.js back-end and APIs
- Set up and customise WordPress sites per client
- Support to handover, and any custom requirement
- Five projects: four on page 2, the featured one on page 3

Trader & Portfolio Manager

2018 — present

Financial markets — independent

- Market analysis and trading over several years
- Portfolio management and asset allocation
- Risk and money management; assess before entry
- Forex — currency pairs and gold on MetaTrader

Technical Skills

- React.js
- Node.js
- JavaScript
- WordPress
- HTML & CSS
- Responsive design
- Figma design systems: tokens and variants
- HTML/CSS to Figma conversion
- APIs and databases
- AI APIs (LLM)
- Technical and fundamental analysis
- Portfolio management
- Risk and money management
- MetaTrader and TradingView

Education

Associate degree, Civil Engineering

Islamic Azad University, Mashhad

Languages

Persian	Native
English	Intermediate

Selected Work

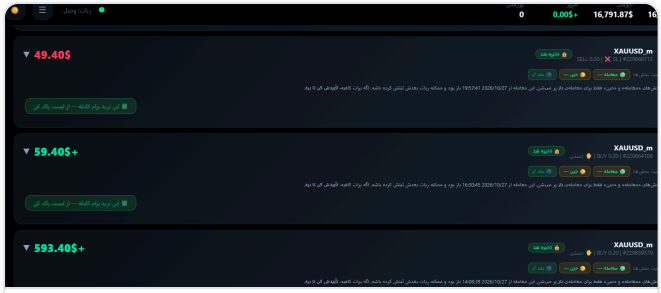

01

Café Hangam — ordering site & admin panel

Smart auto table number · live table & menu panel

An online ordering site for a café, with a dedicated API and an admin panel. The customer only scans the QR code on the table — the table number is detected automatically, so there is nothing to select or type. Tables, orders and menu changes all run from the panel, in sync with the site.

Node.js · REST API · Admin panel · QR code

02

Trade Journal — automated trading log

MetaTrader auto-journal · risk & sentiment

A panel for logging and reviewing trades. Data is pulled from MetaTrader automatically, and a chart screenshot is attached to each trade's own card — even when MetaTrader is closed. Dashboard, results calendar, risk calculator and sentiment review are also automatic. The trader only trades; the app handles the rest.

MetaTrader · Automation · Risk management · Dashboard

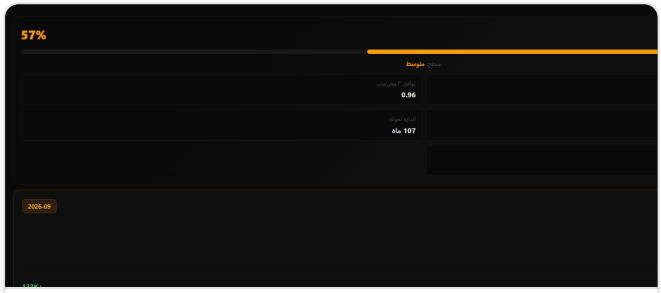

03

Qaleb Khoone — templates & animations

400+ templates and 100 animations per section · no install needed

A ready-made library of page templates, animations and buttons. Pick a template and the system merges the HTML, CSS and JS and delivers one complete file. Animations can also be injected straight into the user's existing project.

HTML/CSS/JS · Smart code merge · Visual library

04

FedMind — Fed decision forecasting

LLM behaviour modelling of four market personas · official Fed and BLS data

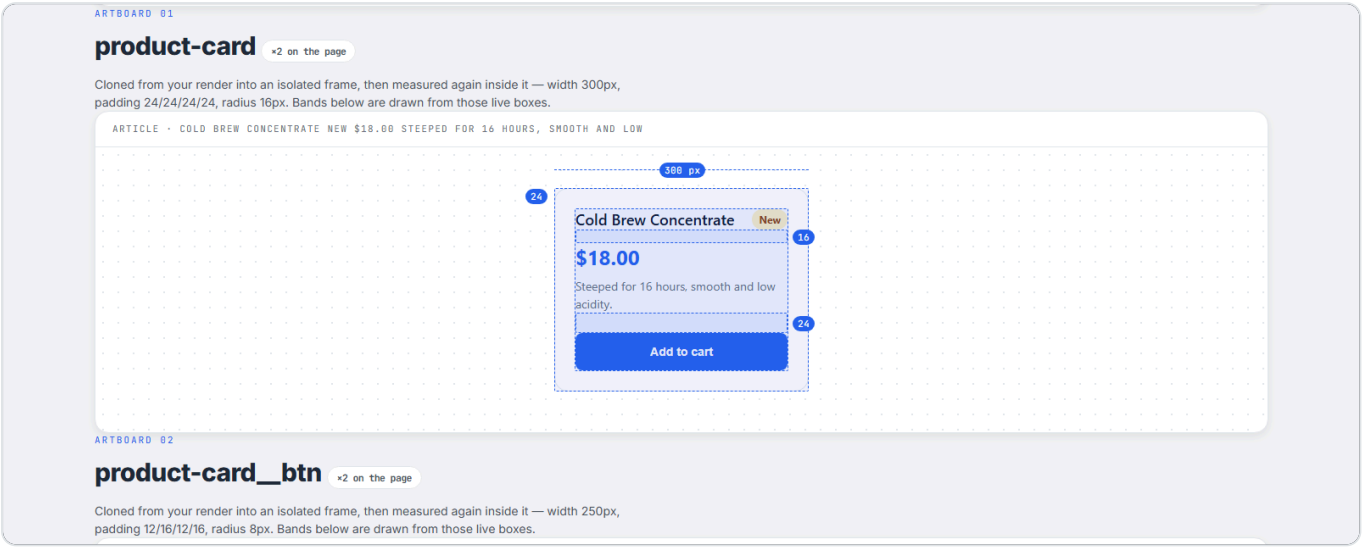

A personal macro-analysis project: it connects to AI APIs to model four trading personas and forecast NFP, CPI and the federal funds rate, using official Fed and BLS data plus formulas I derived myself. It runs on free APIs and reports a confidence level for every forecast.

LLM · Economic data · Forecasting

Featured Project

Figma Forge — a handoff board built from any HTML file

Figma Forge — automated design handoff

Personal project

It reads any HTML file, renders it in a browser, measures the real result and builds the Figma board

Figma Forge is a single-file tool: you drop an HTML file into it and that file opens in a sandbox — your scripts are never executed. Every number on the board then comes out of the render rather than from the CSS text: width, padding, the gap between elements, radius, surface colour, elevation and type size are read with getComputedStyle. Repeated components are detected, and each one is re-rendered and re-measured inside its own isolated frame — that is what the image above shows: an artboard with live measurement bands. What you get back is a complete handoff board that puts design and code on one shared source.

29	13	4	0
automated checks on every board — all passing	real widths measured to find responsive breakpoints	output files: the Figma plugin and its tokens	scripts executed from your file — the security line

- Ticket-10 style board: artboards, spec sheet, tokens and an acceptance checklist
- Real WCAG contrast is computed from the colours that actually paint, and an AA-passing colour is proposed
- Responsive breakpoints come from content height jumps, not from @media rules
- A dark skin is derived from your own tokens, even when the source has no dark mode
- The Node engine renders in a real browser: JS-built DOM, external CSS, CSS variables and hover states
- The acceptance audit re-measures every specimen and compares it back to the source
- Four generated files: Figma plugin, DTCG tokens, design.json architecture and manifest
- No server and no build step — it opens in the browser and does everything there
